Ubuntu Server

A. Partition & Mount

Device Name: /dev/sdb1

File System Type: ext4

Mount Point: /projectdata

Commands used:

```
sudo fdisk /dev/sdb          # create partition (n, defaults, w)
```

```
sudo mkfs.ext4 /dev/sdb1
```

```
sudo mkdir /projectdata
```

```
sudo mount /dev/sdb1 /projectdata
```

Command Outputs:

```
dang@Ubuntu: ~  
dang@Ubuntu:~$ lsblk  
NAME        MAJ:MIN RM   SIZE RO TYPE MOUNTPOINTS  
loop0       7:0      0     4K  1 loop /snap/bare/5  
loop1       7:1      0    66.8M 1 loop /snap/core24/1587  
loop2       7:2      0    19.6M 1 loop /snap/desktop-security-center/150  
loop3       7:3      0    66.8M 1 loop /snap/core24/1643  
loop4       7:4      0     20M 1 loop /snap/desktop-security-center/151  
loop5       7:5      0   273.7M 1 loop /snap/firefox/8107  
loop6       7:6      0    16.5M 1 loop /snap/firmware-updater/226  
loop7       7:7      0    91.7M 1 loop /snap/gtk-common-themes/1535  
loop8       7:8      0   606.1M 1 loop /snap/gnome-46-2404/153  
loop9       7:9      0    11.8M 1 loop /snap/snap-store/1390

sdb         8:16     0    10G  0 disk  
sr0        11:0     1   50.6M  0 rom  /run/media/dang/VBox_GAs_7.2.16  
dang@Ubuntu:~$
```

Figure 1. *lsblk* confirms the new 10 GB disk (/dev/sdb) is detected, unpartitioned.

```

sr0    11:0    1 50.6M 0 rom  /run/media/dang/VBox_GAs_7.2.16
dang@Ubuntu:~$ sudo fdisk /dev/sdb
[sudo: authenticate] Password:

Welcome to fdisk (util-linux 2.41.3).
Changes will remain in memory only, until you decide to write them.
Be careful before using the write command.

Device does not contain a recognized partition table.
Created a new DOS (MBR) disklabel with disk identifier 0xad3b4980.

Command (m for help): n
Partition type
   p   primary (0 primary, 0 extended, 4 free)
   e   extended (container for logical partitions)
Select (default p):

Using default response p.
Partition number (1-4, default 1):
First sector (2048-20971519, default 2048):
Last sector, +/-sectors or +/-size[K,M,G,T,P] (2048-20971519, default 20971519):

Created a new partition 1 of type 'Linux' and of size 10 GiB.

Command (m for help): w
The partition table has been altered.
Calling ioctl() to re-read partition table.
Syncing disks.
dang@Ubuntu:~$

```

Figure 2. Creating partition /dev/sdb1 using fdisk.

```

dang@Ubuntu:~$ sudo mount /dev/sdb1 /projectdata
mount: /projectdata: mount point does not exist.
dmesg(1) may have more information after failed mount system call.
dang@Ubuntu:~$ sudo mount /dev/sdb1 /projectdata
dang@Ubuntu:~$ lsblk
NAME        MAJ:MIN RM  SIZE RO TYPE MOUNTPOINTS
loop0        7:0    0    4K  1 loop /snap/bare/5
loop1        7:1    0   66.8M 1 loop /snap/core24/1587

sdb          8:16   0    10G  0 disk
└─sdb1       8:17   0    10G  0 part /projectdata
sr0         11:0    1  50.6M 0 rom  /run/media/dang/VBox_GAs_7.2.16
dang@Ubuntu:~$

```

Figure 3. Formatting, mounting, and lsblk confirming /dev/sdb1 mounted at /projectdata.

B. Directory Setup & Permissions

Directory Path: /projectdata

Group Assigned: facultygrp (owner, read/write), studentgrp (ACL, read-only)

Permission Level: 770 on facultygrp via chmod, plus an ACL granting studentgrp read+execute (r-x); others have no access

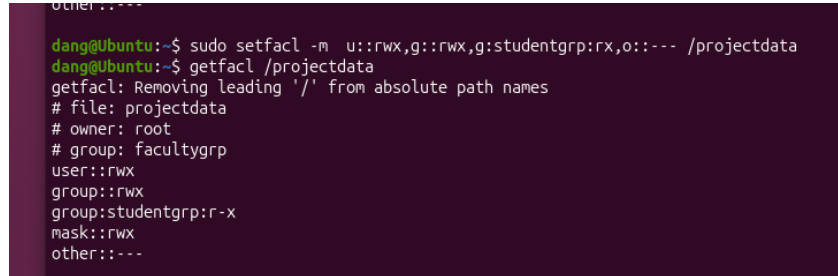

Commands used:

```
sudo chown root:facultygrp /projectdata
```

```
sudo apt install acl -y
```

```
sudo setfacl -m u::rwx,g::rwx,g:studentgrp:r-x,o::--- /projectdata
```

Command Outputs:

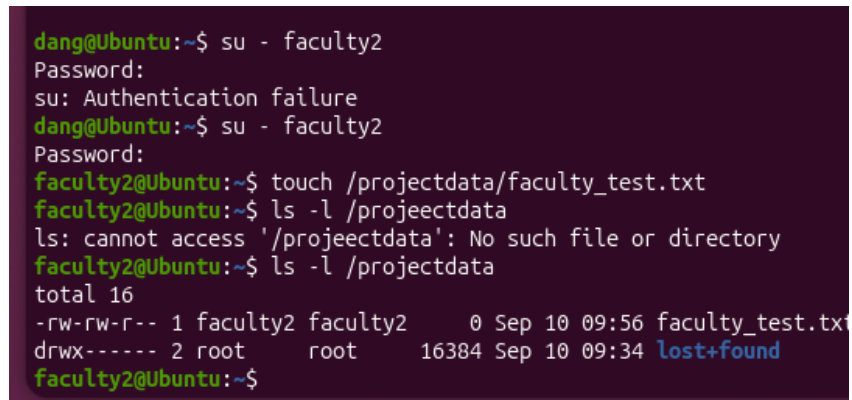

```
other:---
dang@Ubuntu:~$ sudo setfacl -m u::rwx,g::rwx,g:studentgrp:r-x,o::--- /projectdata
dang@Ubuntu:~$ getfacl /projectdata
getfacl: Removing leading '/' from absolute path names
# file: projectdata
# owner: root
# group: facultygrp
user::rwx
group::rwx
group:studentgrp:r-x
mask::rwx
other:---
```

Figure 4. *getfacl* output confirming *facultygrp* has *rwx* and *studentgrp* has *r-x*, with others denied.

C. Verification

Tested User	Action	Access Allowed	Access Denied
faculty2	touch (write)	Yes ✓	—
student4	ls (read)	Yes ✓	—
student4	touch (write)	—	Yes ✓

Command Outputs:

```
dang@Ubuntu:~$ su - faculty2
Password:
su: Authentication failure
dang@Ubuntu:~$ su - faculty2
Password:
faculty2@Ubuntu:~$ touch /projectdata/faculty_test.txt
faculty2@Ubuntu:~$ ls -l /projectdata
ls: cannot access '/projectdata': No such file or directory
faculty2@Ubuntu:~$ ls -l /projectdata
total 16
-rw-rw-r-- 1 faculty2 faculty2    0 Sep 10 09:56 faculty_test.txt
drwx----- 2 root      root      16384 Sep 10 09:34 lost+found
faculty2@Ubuntu:~$
```

Figure 5. faculty2 successfully creates a file in /projectdata.

```
log000
dang@Ubuntu:~$ su - student4
Password:
student4@Ubuntu:~$ ls /projectdata
faculty_test.txt  lost+found
student4@Ubuntu:~$ touch /projectdata/student.test.txt
touch: cannot touch '/projectdata/student.test.txt': Permission denied
student4@Ubuntu:~$
```

Figure 6. student4 can list /projectdata (read) but is denied when attempting to write.

Part 3: Reflection

What challenges did you encounter in creating partitions and managing permissions?

Partitioning and mounting went pretty smoothly, but the permissions part took me a few tries. I accidentally typed `chown 770` instead of `chmod 770` at one point, which set the owner to a weird value instead of actually changing the permission bits. Once I caught that and fixed it, `chmod` still wasn't giving me the result I expected, turns out there was already an ACL sitting on the folder from an earlier command, and that was capping the group permissions even after I changed them. What finally worked was setting all the ACL entries in one single command instead of piecing them together, then double-checking with `getfacl` to make sure `facultygrp` and `studentgrp` each had the right level of access on the same folder.

How can these skills be applied in real-world system administration duties?

This is basically what a sysadmin would deal with when setting up shared storage for a company or school, adding a new disk when a department needs space, then making sure people only get the access they actually need. ACLs come in handy especially when a single folder needs to serve more than one group differently, like faculty and students sharing the same space but needing different levels of access. That kind of setup comes up a lot in schools or offices with several teams working off shared drives.
